

AAGAMISEQ Nanopore Diagnostics

Detecting molecular signatures with sub-nanometer precision. A paradigm shift in early-stage oncology.

Our Ecosystem

We provide a complete, integrated solution for single-molecule sensing, from the physical sensor to the final clinical insight.

Core Readout Device

The Engine of Discovery

High-precision sensing hardware designed for ultra-low noise current measurement from nanopore chips.

- Pico-ampere sensitivity
- 10MHz sampling rate
- Compact benchtop form-factor

Solid-State Nanopore Chips

Custom-Engineered Precision

Silicon-nitride based membranes with atomically precise pores tailored for specific biomarker sizes.

- Custom pore diameters
- High durability
- Sub-nanometer precision

AI Analysis Software

Intelligent Signal Processing

Cloud-native platform that uses deep learning to classify molecular signatures and identify cancer markers.

- Real-time basecalling
- Automated anomaly detection
- Clinical reporting dashboard

Consumables & Kits

Standardized Workflow

Ready-to-use sample preparation kits and buffer solutions optimized for maximum signal-to-noise ratio.

- Fast sample prep
- High stability reagents
- Universal compatibility

How Nanopore Sensing Works

Solid-state nanopores act as high-resolution "smart" filters. Unlike traditional chemical assays, our technology measures individual molecules physically, providing unparalleled sensitivity for detecting trace amounts of cancer biomarkers in blood or urine.

- Molecular Translocation**
Bio-molecules (DNA, RNA, Proteins) are driven by an electric field through a nanometer-sized aperture.
- Ionic Current Blockade**
As molecules pass through, they partially block the flow of ions, creating a unique current signature.
- Signature Analysis**
The magnitude and duration of current changes reveal the molecule's physical and chemical properties.
- Clinical Diagnosis**
Our AI identifies "cancerous" patterns early, allowing for intervention before symptoms even appear.

Driving Global Impact

We are bridging the gap between cutting-edge biophysics and everyday medical practice.

CLINICAL CLINICS

Point-of-Care Diagnosis

Our compact readout device allows small clinics to perform liquid biopsy tests without sending samples to centralized labs, reducing wait times from weeks to hours.

90% Faster Results

RESEARCH LABS

Single Molecule Precision

Empowering biophysicists and oncologists with the tools to study molecular dynamics, epigenetics, and protein folding in real-time at unprecedented resolution.

Sub-nm Resolution

HOSPITALS

Large-Scale Screening

Standardized chips and AI software enable high-throughput screening of entire populations, making early detection a routine part of annual health checkups.

Cost Reduction: 60%

The Minds Behind the Innovation

Our interdisciplinary team combines expertise in quantum physics, semiconductor engineering, and clinical oncology to redefine the future of diagnostics.

Dr. Aris Varma

Chief Executive Officer

PHD IN NANBIOTECHNOLOGY

Former lead researcher at MIT specializing in solid-state nanopore fabrication and DNA translocation dynamics.

Elena Rossi

Chief Technology Officer

SEMICONDUCTOR ENGINEERING

15+ years experience in CMOS sensor design and low-noise amplifier architectures for molecular electronics.

Dr. James Chen

Head of AI & Bioinformatics

DEEP LEARNING SPECIALIST

Architected the proprietary sequence-identification algorithms that power AAGAMISEQ's real-time diagnostic engine.

Dr. Sarah Miller

Chief Medical Officer

CLINICAL ONCOLOGY

Board-certified oncologist focused on integrating early-detection liquid biopsy protocols into standard clinical care.

The Network of Trust

AAGAMISEQ is backed by world-class institutions and forward-thinking investors.

STRATEGIC PARTNERS

Novartis Innovation

Deep Genomics
